Quality Control Oligonucleoti		nucleotide synthesis is	synthesis is monitored base by base through trityl analysis to ensure		
	appro	appropriate coupling efficiency. The oligo is subsequently purified by affinity-solid			
	phase	phase extraction. The annealed RNA duplex is further analyzed by mass			
	spectr	spectrometry to verify the exact composition of the duplex. Each lot is compared to			
	the pr	evious lot by mass sp	ectrometry to ensure maximum	lot-to-lot consistency.	
Components	We of	We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of			
	huma	human CFD gene. Each vial contains 5 nmol of lyophilized siRNA. The duplexes can			
be transfected individually or pooled together to achieve knockdown of the			ockdown of the target		
	gene, which is most commonly assessed by qPCR or western blot.			n blot.

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
