on siRNA to inhibit EFNB2 expression using RNA interference			
EFNB2 siRNA (Human) is a target-specific 19-23 nt siRNA oligo duplexes designed to			
knock down gene expression.			
Lyophilized powder			
EFNB2			
Alternative Names EPLG5; HTKL; LERK5; Ephrin-B2; EPH-related receptor tyrosine kinase ligand 5;		e kinase ligand 5;	
LERK-5; HTK ligand; HTK-L			
Entrez Gene 1948 (Human)			
P52799 (Human)			
> 97%			
Oligonucleotide synthesis is monitored base by base through trityl analysis to ensure			
appropriate coupling efficiency. The oligo is subsequently purified by affinity-solid			
phase extraction. The annealed RNA duplex is further analyzed by mass			
spectrometry to verify the exact composition of the duplex. Each lot is compared to			
the previous lot by mass spectrometry to ensure maximum lot-to-lot consistency.			
We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of			
human EFNB2 gene. Each vial contains 5 nmol of lyophilized siRNA. The duplexes can			
be transfected individually or poole	d together to achieve know	ckdown of the target	
gene, which is most commonly assessed by qPCR or western blot.

**Directions for Use** 

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250  $\mu$ l of DEPC water to get a final concentration of 20  $\mu$ M.
