<b>lity Control</b> Oligonucleotide synthesis is monitored base by base through trityl analysis to er		
appropriate coupling efficiency. The oligo is subsequently purified by affinity-solid		
phase extraction. The annealed RNA duplex is further analyzed by mass		
spectrometry to verify the exact composition of the duplex. Each lot is compared t		
the previous lot by mass spectrometry to ensure maximum lot-to-lot consistency.		
<b>Components</b> We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of		
human OR4L1 gene. Each vial contains 5 nmol of lyophilized siRNA. The duplexes ca		
be transfected individually or pooled together to achieve knockdown of the target		
gene, which is most commonly assessed by qPCR or western blot.

**Directions for Use** 

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250  $\mu$ l of DEPC water to get a final concentration of 20  $\mu$ M.
