Purity	> 97%				
Quality Contr	ol Oligor	Oligonucleotide synthesis is monitored base by base through trityl analysis to ensure			
	appro	priate coupling efficie	ency. The oligo is sul	osequently purif	fied by affinity-solid
	phase	extraction. The anne	aled RNA duplex is	further analyzed	d by mass
	spect	spectrometry to verify the exact composition of the duplex. Each lot is compared to			
	the pr	revious lot by mass sp	ectrometry to ensu	re maximum lot	-to-lot consistency.
Components	We of	We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of			
	huma	human PGM2L1 gene. Each vial contains 5 nmol of lyophilized siRNA. The duplexes			
	can be	can be transfected individually or pooled together to achieve knockdown of the			
	target	target gene, which is most commonly assessed by qPCR or western blot.

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
