Quality Control Oligonucleotide		ucleotide synthesis is	synthesis is monitored base by base through trityl analysis to ensure		
	approj	priate coupling efficie	ncy. The oligo is subsequently p	ourified by affinity-solid	
	phase	phase extraction. The annealed RNA duplex is further analyzed by mass			
	spectr	ometry to verify the e	exact composition of the duplex	. Each lot is compared to	
	the pr	evious lot by mass spe	ectrometry to ensure maximum	n lot-to-lot consistency.	
Components	We of	We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of			
	humar	n H3F3C gene. Each vi	al contains 5 nmol of lyophilize	d siRNA. The duplexes can	
	be tra	nsfected individually o	or pooled together to achieve k	nockdown of the target	
gene, which is most commonly assessed by qPCR or wes			nly assessed by qPCR or wester	rn blot.

Negative Control	2.5 nmol x 1	2.5 nmol x 2
DEPC Water	1 ml x 1	1 ml x 2

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
