| Quality Control Oligonucleotide synthesis is monitored base by base through trityl and | | | gh trityl analysis to ensure | | |
| | appro | priate coupling efficie | ency. The oligo is subsequently p | ourified by affinity-solid | |
| | phase | extraction. The anne | aled RNA duplex is further anal | yzed by mass | |
| | spectr | ometry to verify the | exact composition of the duples | x. Each lot is compared to | |
| | the pr | evious lot by mass sp | ectrometry to ensure maximun | n lot-to-lot consistency. | |
| Components We offers pre-designed sets of 3 different target-specific | | | s of 3 different target-specific si | RNA oligo duplexes of | |
| | mouse | e GABRA1 gene. Each | vial contains 5 nmol of lyophiliz | zed siRNA. The duplexes | |
| | can be | e transfected individu | ally or pooled together to achie | eve knockdown of the | |
| | target | target gene, which is most commonly assessed by qPCR or western blot. | | | |

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
