| Quality Contr | Control Oligonucleotide synthesis is monitored base by base through trityl analysis to | | | gh trityl analysis to ensure | | |
| | appro | appropriate coupling efficiency. The oligo is subsequently purified by affinity-s | | | | |
| | phase | phase extraction. The annealed RNA duplex is further analyzed by mass | | | | |
| | spectr | rometry to verify the | exact composition of the duple | x. Each lot is compared to | | |
| | the pr | evious lot by mass sp | pectrometry to ensure maximun | n lot-to-lot consistency. | | |
| Components We offers pre-designed sets of 3 different target-spe | | | s of 3 different target-specific si | RNA oligo duplexes of | | |
| | mouse | e FBXL17 gene. Each | vial contains 5 nmol of lyophilize | ed siRNA. The duplexes | | |
| | can be | e transfected individu | ally or pooled together to achie | eve knockdown of the | | |
| | target | target gene, which is most commonly assessed by qPCR or western blot. | | | | |

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
