Quality Control Oligonucleotide synthesis is monitored bas			s monitored base by base thro	se by base through trityl analysis to ensure		
	appropriate coupling efficiency. The oligo is subsequently purified by affinity			v purified by affinity-solid		
	phase	phase extraction. The annealed RNA duplex is further analyzed by mass				
	spectr	spectrometry to verify the exact composition of the duplex. Each lot is compared to				
	the pr	the previous lot by mass spectrometry to ensure maximum lot-to-lot consistency.				
Components	We of	We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of				
	mouse	e ZMYM3 gene. Each	vial contains 5 nmol of lyophil	ized siRNA. The duplexes		
	can be	e transfected individu	ally or pooled together to ach	ieve knockdown of the		
	target	target gene, which is most commonly assessed by qPCR or western blot.

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
