Quality Control Oligonucleotide synthesis is monitored base by base through trityl analysis to	Oligonucleotide synthesis is monitored base by base through trityl analysis to ensure			
appropriate coupling efficiency. The oligo is subsequently purified by affinity-	solid			
phase extraction. The annealed RNA duplex is further analyzed by mass				
spectrometry to verify the exact composition of the duplex. Each lot is compa	ared to			
the previous lot by mass spectrometry to ensure maximum lot-to-lot consiste	ency.			
Components We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of				
mouse LPPR5 gene. Each vial contains 5 nmol of lyophilized siRNA. The duple	xes can			
be transfected individually or pooled together to achieve knockdown of the t	arget

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
