| Quality Contro | Oligonucleotide synthesis is monitored base by base through trityl analys | | | trityl analysis to ensure | |
| | approj | priate coupling efficiency | n. The oligo is subsequently pur | ified by affinity-solid | |
| | phase | phase extraction. The annealed RNA duplex is further analyzed by mass | | | |
| | spectr | ometry to verify the exa | ct composition of the duplex. E | ach lot is compared to | |
| | the pro | evious lot by mass spect | rometry to ensure maximum lo | ot-to-lot consistency. | |
| Components | We off | We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of | | | |
| | mouse | e ARSJ gene. Each vial co | ntains 5 nmol of lyophilized siR | NA. The duplexes can | |
| | be trai | nsfected individually or p | pooled together to achieve kno | ckdown of the target | |
| | gene, | gene, which is most commonly assessed by qPCR or western blot. | | | |

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
