| Quality Control Oligonucleotide synthesis is monitored base by base through trityl analy | | | trityl analysis to ensure | | |
| | appro | priate coupling efficie | ncy. The oligo is subsequently pur | ified by affinity-solid | |
| | phase | phase extraction. The annealed RNA duplex is further analyzed by mass | | | |
| | spect | rometry to verify the | exact composition of the duplex. Ea | ach lot is compared to | |
| | the p | revious lot by mass sp | ectrometry to ensure maximum lo | t-to-lot consistency. | |
| Components | We of | We offers pre-designed sets of 3 different target-specific siRNA oligo duplexes of | | | |
| | mous | e RINL gene. Each vial | contains 5 nmol of lyophilized siRI | NA. The duplexes can | |
| | be tra | ansfected individually | or pooled together to achieve know | ckdown of the target | |
| gene, which is most commonly assessed by qPCR or western blot. | | | plot. | | |

Directions for Use

We recommends transfection with 10 nM - 100 nM siRNA 48 to 72 hours prior to cell lysis. Before resuspending, briefly centrifuge the tube to ensure the lyophilized siRNA is at the bottom of the tube. Resuspend the siRNA oligos to an appropriate concentration with DEPC water. For example, resuspend one tube of 5 nmol siRNA oligo in 250 μ l of DEPC water to get a final concentration of 20 μ M.
